

a Opposite-direction perturbation
Tier A $\rho = -0.550$ ($n = 15$)
all scored sets $\rho = -0.455$ ($n = 41$)

b The 15 Tier A sets, both diseases
ordered by HCC effect size; crossing zero is necessary but not sufficient for the mirror gate

c Against the permutation null
10,000 permutations of disease labels;
both levels clear the null

d The mirror travels with the cardiac cohort
every HCC cohort mirrors GSE57338;
neither independent HF RNA-seq cohort does
